Layouts with grid Lab

Our pages are coming along nicely. Let's get some practice with one more layout technique, the CSS grid.

1. Look at landing.html in a browser. Notice that each card may look like this:

Let's say that our client thinks it would look better like this:

Your job is to make that happen. You could use flexbox for that or inline-block or even floats but grid seems to be the best tool for the job.

2. Give the film container a style of display: grid;

3. Create a set of grid-template-columns. It looks like you'll have two columns, the left will be for the poster. The right will be for the film info. And the showing times will be in a second row that spans both columns.

4. Go ahead and create three grid-template-areas. Call them poster, info, and times.

5. Create or modify styles in site.css, assigning the poster's section to the poster grid area, the info's section to the info area, and the showing time's section to the times area.

6. Run and test. You should see something like the above picture.

7. Adjust the paddings and margins to your team's liking.
